

Repo Installation

Follow the steps below to install the Linguistomics Repository on your computer.

Download and install GitHub Desktop

- Click here to go to the GitHub [Download Page](#).
- Follow the instructions for installing GitHub Desktop on your computer.

Clone repo

Open GitHub Desktop and choose "File..Clone Repository..." from the menu bar.

The screenshot shows the 'Clone a repository' dialog box in GitHub Desktop. It has a title bar with a close button (X). Below the title bar are three tabs: 'GitHub.com', 'GitHub Enterprise', and 'URL'. The 'URL' tab is selected. The main area contains two input fields: 'Repository URL or GitHub username and repository' with the text 'https://www.github.com/Linguistomics' and 'Local Path' with the text 'Documents/Linguistomics'. There is a 'Choose...' button next to the 'Local Path' field. At the bottom are two buttons: 'Clone' and 'Cancel'.

GitHub.com	GitHub Enterprise	URL
Repository URL or GitHub username and repository https://www.github.com/Linguistomics		
Local Path Documents/Linguistomics		Choose...
Clone		Cancel

Input names

- Type the url of the repository on GitHub.
- Type the name of the folder on your computer where you want the repository to be stored. If you change this folder, remember it, because you will need it in a later step.
- Click "Clone" and wait for the repo to download.

Download and install Nytril

- Click here to go to [Nytril.com](#).

- Click "Download" at the top of the page.
- Choose your platform and download the installer.
- Run and Complete the installation

Run Nytril Desktop

- On a Mac, the Nytril icon will be in your Applications folder
- On Windows, the icon will be on the desktop.

Open Linguistomics Repo

- Choose File..Open..Repository...
- The Local Folder should be set to the repo download folder from step 2.
- Click OK.

Open the "Paper" Project

- The following dialog box will appear.
- Input the text as shown and click OK.

The "Open Project" dialog box has a light blue header with the title "Open Project" and a close button (X). It contains two text input fields. The first field, labeled "Existing Main File", contains the text "Nytril/Main". The second field, labeled "Name", contains the text "Papers". At the bottom, there are two buttons: a blue "OK" button and a light gray "Cancel" button.

Open the "Create Data Files" Project

- Select "File..Open..Project".
- Input the text as shown and click OK.

The "Open Project" dialog box has a light blue header with the title "Open Project" and a close button (X). It contains two text input fields. The first field, labeled "Existing Main File", contains the text "Nytril/Create Data Files". The second field, labeled "Name", contains the text "Create Data Files". At the bottom, there are two buttons: a blue "OK" button and a light gray "Cancel" button.

Using the two projects

Now that the installation is complete, you can review the documents inside each project. There are 2 projects in the Linguistomics repo that comprise the two main stages of the experiment. You can see these by clicking on the "Projects" menu. Choosing a project reloads all the source files and documents to the way that they were the last time you viewed that project, so you can switch back and forth between the two, without losing your way.

A handy feature of this environment is that by holding down the Ctrl-key and clicking anything in the document, you will be taken to the source of the information in the left-hand pane. Holding down Ctrl-Shift and hovering over an element shows its layout lines. Ctrl-Shift-Click on a diagram to see how the diagram was created in code.

The two projects are:

- **Create Data Files**

This project uses the raw cognate words and segment definitions to build the data files for the MCMC part of the experiment. There are 4 documents in this project:

- 1 **Diagnostics**

Shows the raw data from the data files in a variety of ways in order to allow the researcher to find mistakes in the data.

- 2 **Create Experiment Files**

A control panel with a button that triggers the creation of the experiment files from the raw cognate data. Use this button when the raw data changes and you want to re-run the whole experiment.

- 3 **Configuration File**

Shows the JSON file that is used to initialize the TongueTwister program.

- 4 **Word File**

A copy of the raw data for an experiment.

- **Papers**

This contains the result of the completed experiment.

- 1 **Paper JOLE**

Shows the finished manuscript.

- 2 **Supplemental**

Extra narrative, equations and figures that did not fit into the main paper.

If you have trouble with any of these steps, send an email to [Shawn](#) and he will walk you through any trouble spots.
